

textarea and fieldset in HTML

Textarea Element

The `<textarea>` element is an input element where the user can input **multi-line text**, unlike the `<input type = " text ">` element where there is only a single line.

A text area can hold an unlimited number of characters, and text wrapping is allowed when the form is submitted.

Example : `<form>`
`<textarea placeholder="Type here..."></textarea>`
`</form>`

Browser :

rows and cols Attribute

These attributes are used to set the size of `<textarea>`.

The rows attribute specifies the visible height of a text area.

The cols attribute specifies the visible width of a text area.

Example : `<form>`
`<textarea rows="10" cols="20" placeholder="type here...."></textarea>`
`</form>`

fieldset and legend Elements

The `<fieldset>` element is used to provide **grouping for a part** of an HTML form. The `<fieldset>` tag draws a box around the related elements, which makes it more presentable.

The `<legend>` element provides a **title or explanatory caption** for the rest of the contents of the legend element's parent element. `<legend>` comes just after the `<fieldset>` tag.

Example :

```
<form>
    <fieldset>
    <legend>DETAILS:</legend>
    Name: <input type="text"><br>
    Email: <input type="text"><br>
    </fieldset>
</form>
```
